

Lecture 1: Learn full stack web development using MERN Stack

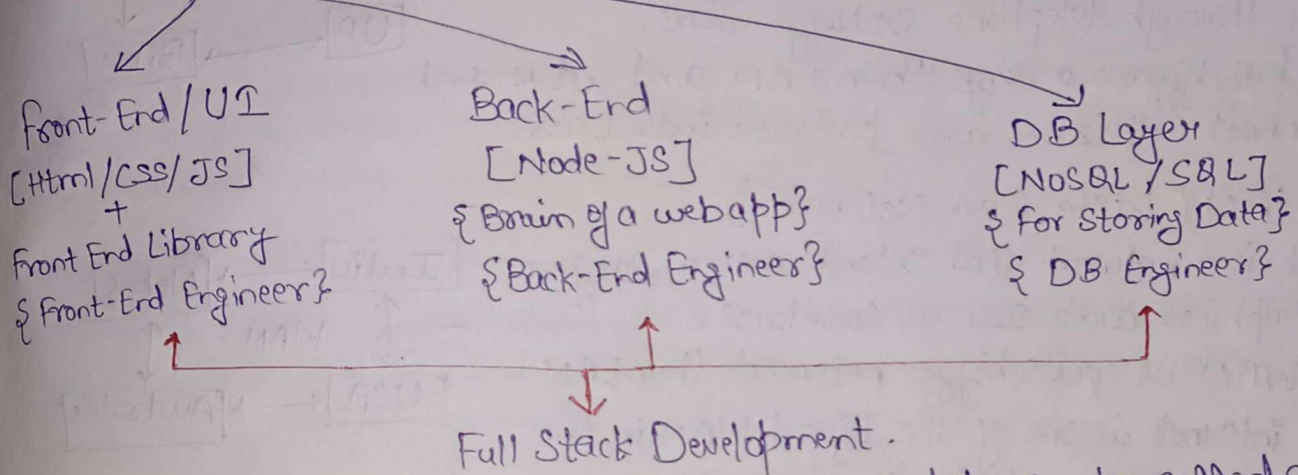

→ What is web development?

Web development refers to the building and maintaining websites and application. It also includes building technical front-end and back-end code that informs the site functionality.

So, basically web is a system where a lot of data or resources are inter-connected with each other and we can access it via using internet.

→ Web Applications

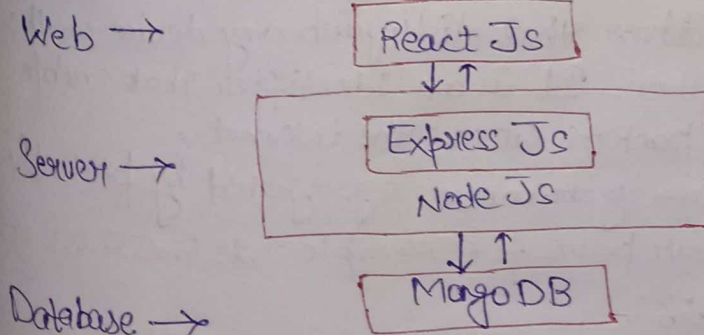

So, the person who knows all above the things then he/she can be called as full stack developer.

→ What is MERN Stack?

MERN stands for MongoDB, Express, React, Node, after the four key technologies that make up the stack.

- MongoDB - document database
- React(.js) - a client side javascript framework
- Node(.js) - the premier javascript web server
- Express(.js) - Node.js web framework

The MERN architecture allows us to easily construct a 3-tier architecture (frontend, backend, database) entirely using javascript and json.
